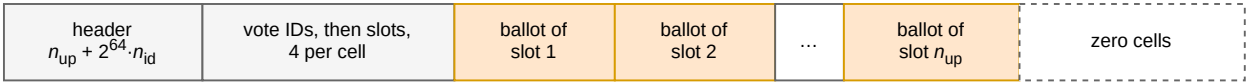
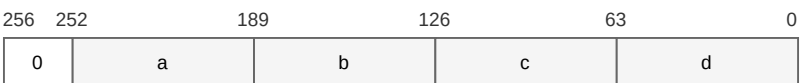
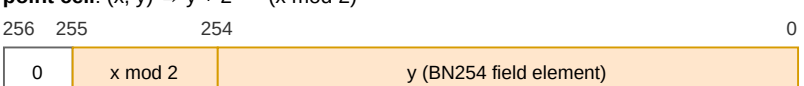
blob cells, in order



packed cell = $a \cdot 2^{189} + b \cdot 2^{126} + c \cdot 2^{63} + d$



point cell: (x, y) → $y + 2^{254} \cdot (x \bmod 2)$



binding to the commitments
for each blob *b*:
z_b = H(`processID` ‖ `stateRoot`^{old} ‖ `blobCommitment`$_b$) mod q_{BLS}
$y_b = p_b(z_b)$
`blobsDigest` = H(`blobCommitment`$_1$ ‖ y_1 ‖ …)
