prover
Ethereum (L1)
L1Block (OP)
process registry (OP)
L1BlobVerifier (OP)
seal batch, build blobs and KZG commitments
batch inputs
blob tx 1: blobs 0-5 (type 3)
tx 1 mined in block B_1
blob tx 2: blobs 6-11 (after tx 1)
tx 2 mined in block B_2
batch proof (ok = 1, pins checked)
wait until the L1 origin reaches B_2 (about 1 min)
headers origin..B_1, tx trie proofs
submitStateTransitionL1(publicValues, proof, commitments, ys, kzgProofs, L1 proof)
verify(L1 proof)
hash(), number()
header chain anchored at the origin or a recorded block; MPT proofs; age ≤ 7200 blocks
versioned hashes, L1 blocks
ZiskVerifier; point evaluation per blob; store new root; emit events
