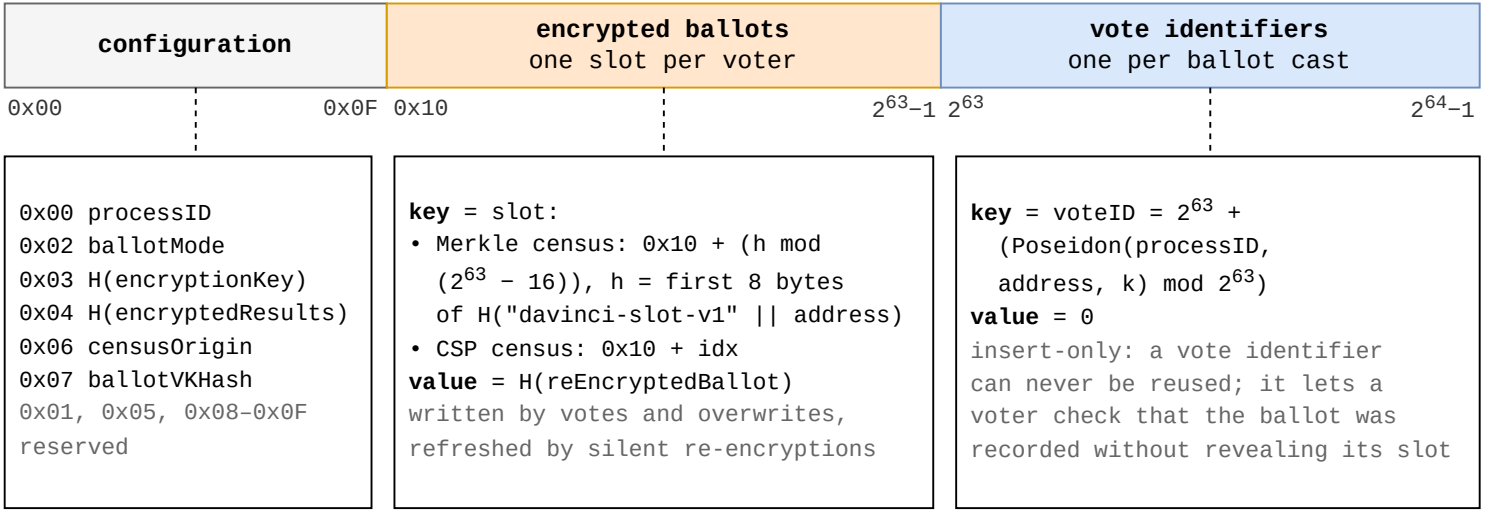
state tree: sparse Merkle tree, depth 64, SHA-256, 64-bit keys; its root is the on-chain **stateRoot**



H = SHA-256 (value read as a big-endian integer). Leaf hash: H(key_{LE8} || $\text{value}_{\text{LE32}}$ || 0x01); internal node: H(left || right). At creation, the registry computes the genesis root of the six configuration leaves, with the accumulator set to the encryption of zero.
